## Author: Ali Yigit 4th Semester Security 2015

How to:

To send and receive encrypted messages you need to create a key pair, which consists of a private and public key.

To send an encrypted message, you need the recipient's public key, which is used to encrypt the message you will send. Your recipient's will then use their own private key to decrypt that message. Your recipient's can send their public key by mail as an attachment file, plain text or they can upload it to a public server from where you can download it from.

## Gpg4win + thunderbird+enigmail - how to

To create a key pair you can use both Kleopatra and GPA, which is included in the Gpg4win software. You must fill in your name, email and a password when creating a new key pair.

The public key can be exported to uploaded to a public server from both Kleopatra and GPA or be sent using thunderbird. Here it is shown how to do it in GPA:

To import a public key, you can do it within Thunderbird itself, or you can add it manually to your keymanager program. You can search for keys on different public servers:

	Import OpenPGP Key	
	Decrypt and Open	
	Decrypt and Save As	
A 1 attachment: 0xD467D144 as	Verify signature	

To encrypt your messages, you can use the thunderbird plugin Enigmail which is quite simple to use, or you can your key-manager programs to generate an encrypted message using the recipient's public key.

Using Thunderbird:

🗠 Ny meddelelse: (intet emne)	-	×
<u>Filer R</u> ediger <u>V</u> is Valgmuligheder E <u>n</u> igmail sunktione <u>Hj</u> ælp		
🎬 Send 🖌 Stavekontrol 🔻 🛡 Vedhæft 🔻 🖨 S/MIME 🔻 🔚 Gem 🔻		
Enigman: > 🔓 🖉 Attach My Public Key < cos message v ill be unsigned and unencrypted		
· Fra: Til:		~
<u>E</u> mne:		

Or you can do your encryption inside GPA or Kleopatra. When using the gpa clipboard you will have to copy and send the encrypted message manually.

When receiving a mail, Thunderbird will automatically decrypt the messages encrypted with your public because of the addon Enigmail. You can however also decrypt and encrypt the messages inside clipboard within the GPA program: To encrypt a message click the encrypt button and select the recipient's public key and to decrypt a message you can just copy and paste the encrypted message.
